(57) **ABSTRACT**

Support structures that reduce rotation of a door crown are disclosed. An example dishwasher for treating dishes according to a cycle of operation includes a tub defining a treating chamber with an opening, and a door movably mounted to the tub to selectively open and close the opening. The door may include a front panel, a pocket panel coupled to the front panel and defining an opening in the front panel to receive a hand, a crown attached to a top of the front panel, a pocket handle defined in the crown having a first support structure engaging a second support structure of the pocket panel to reduce a rotation of the crown.
